Trajectory: sequence of nodes on networks with no spatial information.

Let G = (V, E) is a connected and undirected graph We use the topology of the graph G to define a trajectory.

A trajectory (Timed walk) is a time-stamped sequence of nodes

 $T_1 = \langle \rangle \\ T_2 = \langle \rangle$

Let G = (V, E) is a connected and undirected graph We use the topology of the graph G to define a trajectory.

A trajectory (Timed walk) is a time-stamped sequence of nodes

$$\begin{split} t &= 0 \\ T_1 &= \langle (v_1, [0, 0]) \rangle \\ T_2 &= \langle (v_4, [0, 0]) \rangle \end{split}$$

shima.moghtased@di.unipi.it

Trajectory Similarity

Let G = (V, E) is a connected and undirected graph We use the topology of the graph G to define a trajectory.

A trajectory (Timed walk) is a time-stamped sequence of nodes

$$\begin{split} t &= 1 \\ T_1 &= \langle (v_1, [0, 1]) \rangle \\ T_2 &= \langle (v_4, [0, 1]) \rangle \end{split}$$

Time Restricted Trajectory

Given a trajectory T and a time interval t = [s, e], the time restricted trajectory T[t] is the sequence of pairs $(u_i, t_i) \in T$ such that $t_i = [s_i, e_i]$ has overlap with t = [s, e] (i.e. $t_i \cap t \neq 0$).

 $T = \langle (v_1, [0, 3]), (v_2, [4, 4]), (v_3, [5, 8]), (v_4, [9, 11]), (v_5, [12, 14]) \rangle$ For time interval t = [4, 11], we have : $T[t] = \langle (v_2, [4, 4]), (v_3, [5, 8]), (v_4, [9, 11]) \rangle$

k-MsTraj: Approach

Shrinking approach

Idea

- ✓ Presenting a comprehensive representation of trajectories
- ✓ Reducing the number of shortest path distance computations
- ✓ Reducing query processing time

イロト イポト イヨト イヨト

イロト イポト イヨト イヨト

Query Processing

For a query trajectory Q within time interval t,

First: Making shrunk trajectory of $Q[t] \rightarrow \hat{Q}[t]$

Second: By making use of VoNTrajl, for each $(c_i, t_i) \in \hat{Q}[t]$ find trajectories traversing the nodes belonging to the group with center c_i

within $t_i \rightarrow \left| \tilde{\Gamma} = \cup_{(c_i, t_i) \in \hat{Q}[t]} \Gamma_{(c_i, t_i)} \right|$

SHQ

For each $T \in \tilde{\Gamma}$:

(I) Compute $Sim(\hat{Q}, T, t)$, as an estimation of Sim(Q, T, t)

SHQT

For each $T \in \tilde{\Gamma}$:

(I) Making shrunk trajectory of $T \rightarrow (\hat{T})$ (II) Compute $Sim(\hat{Q}, \hat{T}, t)$, as an estimation of Sim(Q, T, t)

< □ > < □ > < □ > < □ > < □ > < □ >

SHQ
For each
$$T \in \tilde{\Gamma}$$
:
 $Sim(Q, T, t) \rightarrow Sim(\hat{Q}, T, t)$ SHQT
For each $T \in \tilde{\Gamma}$:
 $Sim(Q, T, t) \rightarrow Sim(\hat{Q}, T, t)$ $d(u, v)_{u \in T, v \in Q} \rightarrow d(u, c_j)_{u \in T, c_j \in \hat{Q}}$ $d(u, v)_{u \in T, v \in Q} \rightarrow d(c_i, c_j)_{c_i \in \hat{T}, c_j \in \hat{Q}}$ $d \rightarrow \bar{d}$ $d \rightarrow \tilde{d}$ Lemma $\tilde{d} \leq d \leq 3\bar{d}$

 $\gamma_2 \rightarrow$ Estimated output set of k-MsTraj query

$$SSR(\gamma_1, \gamma_2) = \frac{\sum_{T \in \gamma_1} Sim(Q, T, t)}{\sum_{S \in \gamma_2} Sim(Q, S, t)}$$
$$IR(\gamma_1, \gamma_2) = \frac{|\gamma_1 \cap \gamma_2|}{k}.$$

• • • • • • • • • • • • • •

IR Ratio

IR values show better performance for SHQT in comparison with SHQ.

æ
SSR Ratio

SSR values for both SHQ and SHQT are almost close to 1.

æ

★週▶ ★ 国▶ ★ 国▶

Conclusion

- $\checkmark\,$ SHQ and SHQT are effective w.r.t the BaseLine method.
- $\checkmark\,$ SHQT provides a fast solution with an acceptable precision.
- $\checkmark\,$ SHQ is more efficient, querying long trajectories
- $\checkmark\,$ SHQ is more efficient, facing with a set of long trajectories
